

Client Scripts and UI Policies

Customer Journey Map – Client Scripts and UI Policies – Control the ServiceNow Incident Form Dynamically

Persona: ServiceNow Administrator / Developer, with the service desk agent / end user as the affected user. Based on the Empathy Map and Problem Statements of the project team.

SCENARIO Configuring, testing and using Client Scripts and UI Policies to control the Incident form without submitting it	Entice How does someone initially become aware of this process?	Enter What do people experience as they begin the process?	Engage In the core moments in the process, what happens?	Exit What do people typically experience as the process finishes?	Extend What happens after the experience is over?
Steps <i>What does the person (or group) typically experience?</i>	- Agents complain that the Incident form is confusing and allows incomplete data - Administrator reviews recent incidents and finds missing close notes and wrong categories - Finds that the form shows every field all the time and does not guide the user - Decides to control the form with UI Policies and Client Scripts	- Open the Incident form and the Client Scripts and UI Policies modules - Identify the fields to control (Category, State, Impact, Urgency, Short description, Close notes) - Create the first UI Policy with a condition	- Add UI Policy actions: mandatory, visible and read-only - Write onLoad, onChange and onSubmit Client Scripts using g_form - Test by changing fields and checking that the form reacts without saving - Fix script errors and condition mistakes	- Verify each rule for every State, Category and Priority combination - Confirm the form cannot be saved with invalid data - Check the browser console for script errors - Share the results with the team leader	- Document the project outcome - Reuse the same patterns for other forms - Watch support feedback and incident data quality - Update scripts and policies when fields or processes change
Interactions <i>What interactions do they have at each step along the way?</i>	People: Service desk agents, manager, team leader Places: ServiceNow instance; team discussions Things: Incident list, sample incidents, data quality reports	People: Team leader and teammates Places: Incident form, System Definition > Client Scripts, System UI > UI Policies Things: Incident fields, UI Policy form, Client Script form	People: Testers and teammates Places: Script editor, Incident form, browser developer tools Things: UI Policy conditions and actions, g_form scripts, test incidents	People: Team leader, manager Places: Incident form and browser console Things: Test results, screenshots, console output	People: Service desk agents, end users Places: Live instance and support queue Things: Client Scripts, UI Policies, update sets, feedback
Goals & motivations <i>At each step, what is a person's primary goal or motivation? ("Help me..." or "Help me avoid...")</i>	- Help me find where wrong data enters the form - Help me show how the form can guide users	- Help me set up a clean test incident quickly - Help me choose between a UI Policy and a Client Script	- Help me control fields correctly as the user works - Help me avoid blocking legitimate updates	- Help me confirm that no rule is broken or missed - Help me show that data entry errors are reduced	- Help me keep the rules correct as things change - Help me reuse this logic elsewhere
Positive moments <i>What steps does a typical person find enjoyable, productive, fun, motivating, delightful, or exciting?</i>	Clear awareness of the problem before more bad data is entered	- UI Policies are easy to build without code - Work is clearly divided among team members	- The form reacts straight away when a field changes - Logic is reusable once the script works	- Confidence that mandatory and read-only rules work - Cleaner, more complete incident records	- Fewer corrections and follow-up questions - Better user experience for agents
Negative moments <i>What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?</i>	- Colleagues say "just train the agents" - Wrong data is found only after the incident is saved	- Unsure when to use a UI Policy and when a Client Script - Confusion about the order in which rules run	- Client Script errors are hard to trace - Conflicting UI Policies and scripts on the same field - Fear of making fields mandatory too often	- Rules behave differently for some States or roles - Users say "I can't save my incident!"	- Scripts may break when fields or choices change - Too many rules make the form slow or hard to maintain

SCENARIO Configuring, testing and using Client Scripts and UI Policies to control the Incident form without submitting it	Entice How does someone initially become aware of this process?	Enter What do people experience as they begin the process?	Engage In the core moments in the process, what happens?	Exit What do people typically experience as the process finishes?	Extend What happens after the experience is over?
Areas of opportunity <i>How might we make each step better? What ideas do we have? What have others suggested?</i>	• How might we quickly list the fields that need rules?	• Use one standard set of test incidents • Keep a one-page note on UI Policy vs Client Script	• Prefer UI Policies where possible and scripts only when needed • Keep a test matrix of State × Category × field	• Show clear messages so users know why a save is blocked • Produce a short test report	• Use reusable script patterns • Review rules on a regular schedule
