

Functional & Performance Testing

Model Performance Test

Date	03-10-2026
Team ID	SWTID-2026-8713
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	10 Marks

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass / Fail
FT-01	Short description mandatory	Open a new Incident form; leave Short description empty; click Submit.	Short description is marked mandatory and the incident is not saved until it is filled.	To be recorded after testing	Pending
FT-02	Close code / Close notes mandatory on Resolved	Open an incident; change State to Resolved (then Closed) without filling Close code and Close notes; click Update.	Close code and Close notes become mandatory immediately and the save is blocked until both are filled.	To be recorded after testing	Pending
FT-03	Mandatory rule reverses	After FT-02, change State back to In Progress.	Close code and Close notes are no longer mandatory; the form can be saved.	To be recorded after testing	Pending
FT-04	Show / hide On hold reason	Change State to On Hold, then to another State.	On hold reason appears for On Hold and is hidden for other States without reloading the form.	To be recorded after testing	Pending
FT-05	Read-only fields on closed incident	Open a Closed incident as a normal user and try to edit the controlled fields.	The controlled fields are read-only and cannot be edited.	To be recorded after testing	Pending
FT-06	onLoad initial state and guidance	Open a new Incident form and an existing Closed incident.	The form opens with the correct default state and shows the guidance message.	To be recorded after testing	Pending
FT-07	onChange updates dependent fields	Change Category, State, Impact and Urgency one at a time (also while the form is loading).	Dependent fields update only when the user changes the source field, not while the form is loading.	To be recorded after testing	Pending
FT-08	onSubmit validation	Submit with invalid data (empty Short description, or Resolved without Close notes); then submit with valid data.	Invalid data shows a clear message and the save is blocked; valid data is saved.	To be recorded after testing	Pending
FT-09	Activate / deactivate rules	Deactivate one UI Policy and one Client Script, reload the form, then activate them again.	The behavior stops when a rule is inactive and returns when it is active; other rules are unaffected.	To be recorded after testing	Pending
FT-10	No script errors	Repeat the tests with the browser developer console open.	No JavaScript errors appear in the console for any rule.	To be recorded after testing	Pending
PT-01	Form Load Time	Use a timer to measure how long the Incident form takes to load with all UI Policies and Client Scripts active.	Form loads in under 3 seconds.	To be recorded after testing	Pending

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass / Fail
PT-02	Field Change Response	Change State, Category, Impact and Urgency and time how long the dependent fields take to react.	Fields react immediately (under 1 second) without reloading the form.	To be recorded after testing	Pending
PT-03	Many Rules on One Form	Open incidents in every State/Category combination with all rules active, including several in a row.	No slowdown, no conflicting rules and the same values always give the same behavior.	To be recorded after testing	Pending

Note: Actual Result and Pass / Fail are filled in by the tester (Sakthivel S) while executing each test on the ServiceNow instance. Performance targets are stated in the Expected Result column.
